

# DEWATERING POTS, KOPS & WELLHEADS

## Overview

Successful removal of condensate from landfill gas systems requires the installation of dewatering fabrications of a proven design. Cygnet dewatering and Knockout pots (KOPs) are designed to absorb differential pressures with the sump without overspill and encourage maximum condensate drop out. The addition of a Cygnet sentinel would make our pneumatic KOP package complete.

All our fabrications are based upon the very highest grade materials. Our bespoke gas and leachate wellheads are no exception, we make great effort to see that these are designed completely in line with customers requirements.
