

LEACHATE & CHEMICAL TANKS

Overview

For Liquid storage or attenuation above and below ground thermoplastics are the materials of choice for the 21st century.

This is due to the significant cost savings over other materials, ease of prefabrication and installation due to its lighter weight, high chemical resistance of the material and superb durability and toughness.

HDPE and polypropylene tanks are now becoming the norm rather than the exception.

At Cygnet, we take great pride in our attention to detail all tanks are fabricated to exacting client requirements and on site installation and final fix can be offered if required. We are as much at home supplying a full turnkey package or components for larger systems.
