

MANIFOLD & BOX ENCLOSURES

Overview

HDPE is a material which lends itself to all types of fabrication including cuboid or box chambers.

There are many such enclosures used within landfill Collection systems, typically used to house gas or leachate control manifolds.

Box enclosures have multiple applications from closing chambers to cuboid holding tanks and filter vessels to side wall chambers. Cygnet have worked with various clients to produce "chest" type enclosures of various shapes for varying applications, from manifolds to dosing chests and side riser chambers.
