

# PUMP STATION & VALVE CHAMBERS

## Overview

Concrete pump stations are almost always beset with problems due to settlement or disturbance, resulting in structural damage and subsequent leakage. This is due to the inflexibility of hard construction.

Bespoke HDPE pump stations avoid lengthy and hazardous in situ construction and provide a strong but flexible alternative. As stations are prefabricated with either integrated or separate valve chambers, installation is swift and safe.

Stand alone valve chambers of diameters up to 2.4m offer the same advantages and variations on diameters and depths can offer huge flexibility to contractors and clients alike.
