

RL WELLHEADS

Overview

One of the most impressive successes within our design and development department, has been the telescopic wellheads or "Rocket Launchers" as we call them. As an installation the RL system is a simple and very effective solution to gas and odour migration from around and within concrete leachate towers.

The RL is a 2 part HDPE telescopic chimney which seals in gases and odours yet allows residual waste mass settlement, without stressing the plastic cap.

Installation can be carried out by a specialist contractor in 2 days. The "Rocket launcher" nickname was derived from how these fabrications look with the large triangular supporting HDPE gussets around the base.
