

UNDERGROUND WATER STORAGE TANKS

Overview

Planning and environmental pressures demand increasing numbers of subterranean water storage facilities, whether they be rain water harvesting storm attenuation or water filtration tanks.

Cygnnet has worked with many clients assisting them to facilitate their water storage and filtration needs by the fabrication of bespoke tanks.

In order to maximise capacity, horizontal orientation of the tank is most effective. End turrets assist with structural strength as well as offering easy access for maintenance. Mid section inspection portals can also offer options. These types of tanks can be manufactured as modules giving infinite containment flexibility.
